Lab2 what I learned to do

I learned how to use fork() in order to get a new process(or child process). From that new process I learn how to exec a new program while keeping the old program running in the old process(or parent process).
I learned about the wait() function and how it is use to get the parent process to wait for the child process to finish.
I learned how the flow of control works in fork() and exec().
Learned how the process ID of a child is 0 until exec() is called to start the child program, which then it get assigned a non-zero process ID.
